

Modeling Solute Transport Processes in a Plant-Soil System

A WATER FLOW IN SOIL AND ROOTS

B SOLUTE FLOW IN THE SOIL

C SOLUTE FLOW IN ROOTS

- Hormonal signaling in roots
- Rate of signal production is a function of root pressure head
- Decrease in stomatal conductance as a function of leaf water potential and hormone concentration in the leaf [Tardieu et al. 1998]
- Relative stomatal aperture α is a reduction factor between zero and one that it multiplied to T_{pot} :

$$\alpha = e^{\beta[\text{signal}]} e^{\delta H_{\text{Leaf}}}$$

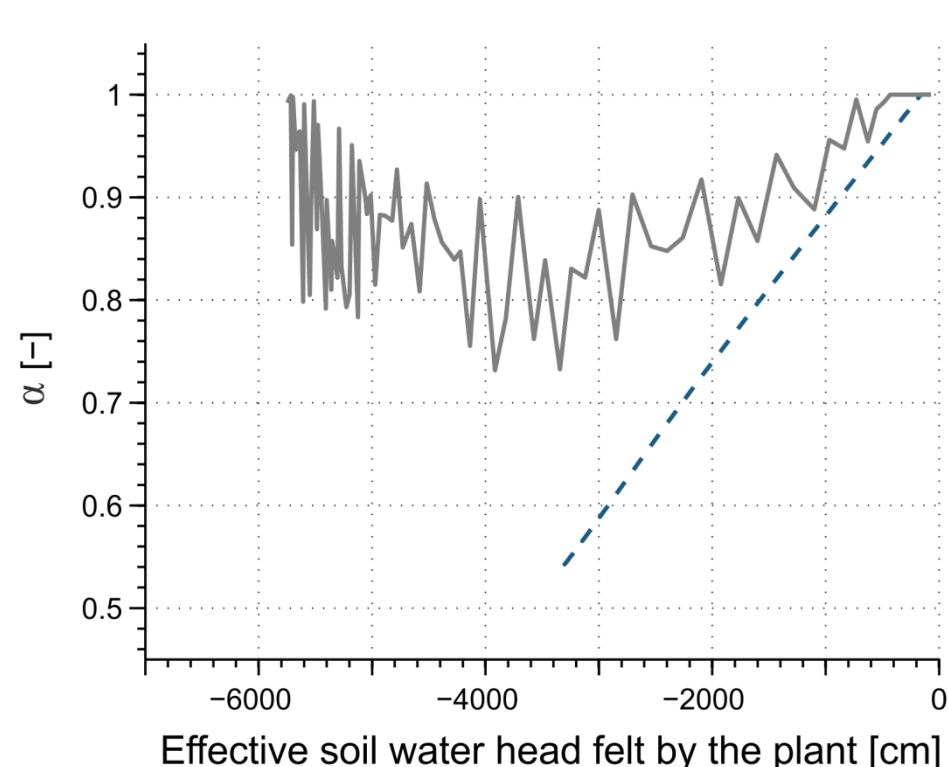

Figure 4: Closeup of parts of the root system with hormone particles

CONCLUSION & OUTLOOK

- Implementation using the open-source simulator DUMUX
- Combination of solute transport in soil and roots → Salt or solute uptake.
- Adaption of σ to adjust plant resistance in case of prolonged salinity.
- Change of root hydraulic conductivities due to either daptation to soil solutes or hormone concentrations.
