Questions

- What makes the GW-SW interaction at the regional scale different from smaller scales?
- What are the *relevant processes* of the GW-SW interaction at the regional scale?
- What *process descriptions* (models in the broadest sense) are suitable to the regional scale to provide adequate results?

Universität Stuttgart Joint IAHS & IAH International Convention, Hyderabad, 6-12 September 2009

- **Regional (or large) Scale:**
 - River Basins (or geographically, politically defined areas) > ~10000 km²

Universität Stuttgart Joint IAHS & IAH International Convention, Hyderabad, 6-12 September 2009

1. Integrated Water Resources Management IWRM

An integrated view on the water cycle must account for relations between:

- **Sources** and **sinks** (flow and transport)
- **Suppliers** and **consumers**
- **Ecological** and **economical** flows
- ...

→ Large distances - long travel times

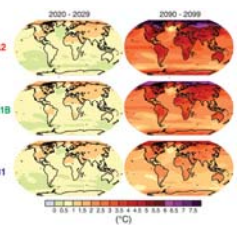

Universität Stuttgart Joint IAHS & IAH International Convention, Hyderabad, 6-12 September 2009

2. Political and Socio-Economic requirements

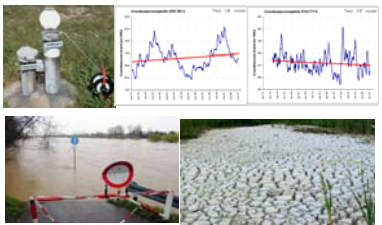

- Political Framework
 - E.g. the European Water Framework Directive → RBMPs
- International Programs
 - e.g. HELP: Hydrology for the Environment, Life and Policy
 - E.g. Global Water Initiative
 - ...
- Transboundary Water Management Issues & Conflicts
 - ...

Universität Stuttgart Joint IAHS & IAH International Convention, Hyderabad, 6-12 September 2009

3. Climate Change

Global

Local

Universität Stuttgart Joint IAHS & IAH International Convention, Hyderabad, 6-12 September 2009

Processes at the Regional Scale?

- The **basic processes** are essentially the same on all scales, however,
 - The relative relevance of different processes changes
 - For practical reasons many processes must be neglected or simplified
- Development of process descriptions for the large scale can either
 - Start from an analysis of the essential processes
 - Start from the objectives of large scale modeling and available data etc.

Universität Stuttgart Joint IAHS & IAHR International Convention, Hyderabad, 6-12 September 2009

The "point" scale

Cross Section

Plan View

- Direct, detailed measurement of physical, chemical and biological **properties** is possible as thus
- Detailed quantitative description of **processes** is possible

Universität Stuttgart Joint IAHS & IAHR International Convention, Hyderabad, 6-12 September 2009

The „local scale“

Cross Section

Plan View

- Increasing influence of adjacent aquifers and water bodies
- Larger distance between observations:
 - assumptions on distribution of properties
 - spatial interpolation and aggregation
 - increasing heterogeneity
 - increasingly lumped process description

Universität Stuttgart Joint IAHS & IAHR International Convention, Hyderabad, 6-12 September 2009

The "sub-catchment scale"

Cross Section

Plan View

- Low spatial frequency of observations
- Increasing relevance of topographical effects and regional flow
- Alluvial valley fills may no longer be the most important aquifer

Universität Stuttgart Joint IAHS & IAHR International Convention, Hyderabad, 6-12 September 2009

Regional Scale: Example: Neckar Catchment, Germany ~14000 km²

Universität Stuttgart Joint IAHS & IAHR International Convention, Hyderabad, 6-12 September 2009

Relevant Processes and Process Descriptions

Point: ~10¹ m²

Local: ~10⁵ m²

Sub-Catchment : ~10⁸ m²

Regional: ~10¹² m²

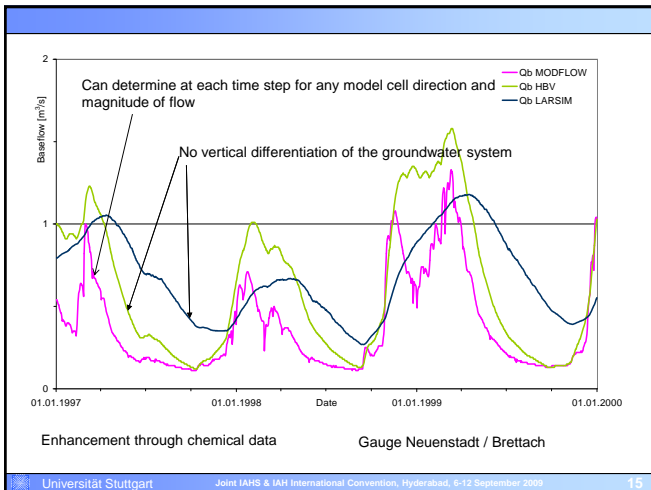

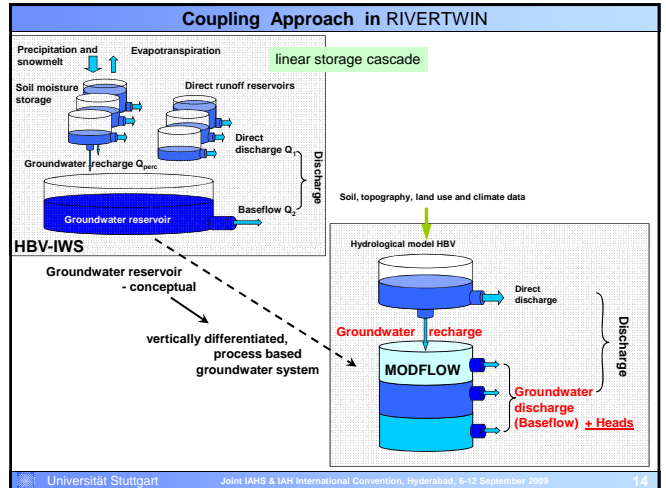

Universität Stuttgart Joint IAHS & IAHR International Convention, Hyderabad, 6-12 September 2009

Process descriptions and Models

3 main options:

1. Full upscaling of process descriptions
2. Replace "processes" by "balances": in = out + storage ...
3. Define **specific process descriptions** for the regional scale *including*
 - Spatially distributed, enhanced concepts to estimate **Groundwater Recharge** and **"Base Flow"** on the regional scale
 - Consideration of processes in the deep unsaturated zone
 - Multi-criteria model development, calibration and validation

Universität Stuttgart Joint IAHS & IAH International Convention, Hyderabad, 6-12 September 2009 12

Conclusions

- The analysis of **GW-SW interaction at the regional scale** is necessary to meet the requirements of IWRM, WFD and investigations concerning the effect of Global (Climate) Change.
- Detailed, physically based process descriptions might not be required for most **practical regional scale management problems**, however they may in some cases increase options for validation and thereby increase predictive capabilities and decrease uncertainty of models

Universität Stuttgart Joint IAHS & IAH International Convention, Hyderabad, 6-12 September 2009 16

Understanding and modeling the interaction of Groundwater and Surface Water on *large* spatial and temporal scales
